

Chloe Derba

Assignment: Write a Simple Test Plan

Name: **MyGratitude**

What does it do? Users can share entries including positive messages and words of support to their friends. Friendly to different recovery spaces and enables individuals to connect with friends in a controlled space about progress. Users can add friends and make themselves discoverable to add. Posts can be of different formats and offer reactions/c

Who will use it? People seeking connectivity to others in therapeutic and recovery spaces

Decide what parts of your app you want to make sure are working 100%.: Features:

- Contact list visible to individual user
- Sharing: Direct message vs select audience vs full audience
- Discoverability/ contact Invite approval
 - Invite via phone number, QR code, text or email invite,
- Different formats for entries
 - Journal entries
 - Prompts
 - Topic
 - Quote
- Filter what is shown in feed

What do you hope to achieve by testing?

Ensuring user can control audience that sees their entries/posts - **privacy**

What parts of the app will you test? Are there parts you won't test this time?

Will test:

audience selection - within each post when posting and presenting on feed

Will not test:

Log in/outdiscoverability; profile content/display; selection of format; display cohesiveness

How will you test the app? Will you click through it yourself, or will you ask friends to help find bugs?

Friends will help find bugs with different individual accounts.

- Contact list is created and approved by users. Testing to ensure that only select or all individual contacts share posts.
- Users will use app side by side during testing to create 7 example posts with either all contacts, only 1 contact as audience, or only two out of the three testers as audience (A, B, C, AB, AC, BC, all)
- Users will check their feed to see if privacy setting applies or if default to "all" occurs and contacts not selected can see post they shouldn't

What do you need for testing? (e.g., a phone or computer, maybe a notepad to jot down notes)

Myself and two friends will conduct testing of this function. Each will need different devices and separate accounts. We will check if posts are able to be set to "all friends" vs. "custom" when posts are made on profile feed. Internet access to all three devices and contact information for each tester.

When do you plan to do the testing? How much time do you think you'll need?

Testing will take place after product is equipped with the features of sharing and making posts, and adding contacts. Testing will take less than 1 hour for myself and three other participants to add each other and create different posts which will be checked in each other's feed for visibility.

What will you have by the end of testing? (e.g., a list of bugs you found, suggestions for making the app better)

Testing will give us the assurance that users will have control over their privacy settings and the trust in the app to use it for its purpose as a space to share comfortably. The privacy setting of all audience vs. select audience will be confirmed and if it does not work, bug will be fixed to ensure audience selection displays correctly and default to "all" does not occur.

Who's doing what?

I will create my contact list as a tester with 2 other friends who will have myself and each other as contacts. Friends will check if they can see my 7 posts when I select all vs. one or two out of the three to share it with.

Think about what could go wrong during testing and how you'd fix it.

Contacts already in phone could interfere if added by number - new bug would be identified. Would be tested by removing contacts and running this test again. Other two testers aside from self can try to remove each other when I test my privacy on a post to see if common contacts affect visibility.

Signature:

A handwritten signature in black ink, consisting of a large, stylized 'J' followed by a smaller 'e' and an arrow pointing upwards and to the right.
